Only You Can Prevent Surgical Fires
Surgical Team Communication is Essential

The applicability of these recommendations must be considered individually for each patient.

At the start of surgery:
- Enriched O₂ and N₂O atmospheres can vastly increase flammability of drapes, plastics, and hair. Be aware of possible O₂ enrichment under the drapes near the surgical site and in the fenestration, especially during head/neck surgery.
- Do not drape the patient until all flammable preps have fully dried.
- Fiberoptic light sources can start fires: Complete all cable connections before activating the source. Place the source in standby mode when disconnecting cables.
- Moisten sponges to make them ignition resistant in oropharyngeal and pulmonary surgery.

For surgery with open delivery of supplemental O₂:
- Question the need for 100% O₂ for open delivery during head/neck surgery.
- As a general policy, use air or ≤30% O₂ for open delivery to the face.
- Arrange drapes to minimize O₂ buildup underneath.
- Keep fenestration towel edges as far from the incision as possible.
- Use an incised drape to isolate head and neck incisions from O₂ and alcohol vapors.
- Coat head hair and facial hair (e.g., eyebrows, beard, moustache) within the fenestration with water-soluble surgical lubricating jelly to make it nonflammable.
- For coagulation, use bipolar, not monopolar electrosurgery.

During oropharyngeal surgery:
- Scavenge deep within the oropharynx with separate suction to catch leaking O₂ and N₂O.
- Soak gauze or sponges used with uncuffed tracheal tubes to minimize gas leakage into the oropharynx, and keep them wet.

When performing electrosurgery, electrocautery, or laser surgery:
- Stop supplemental O₂ (if O₂ concentration is >30%) at least one minute before and during use of the unit, if possible.
- Activate the unit only when the active tip is in view (especially if looking through a microscope or endoscope).
- Deactivate the unit before the tip leaves the surgical site.
- Place electrosurgical electrodes in a holster or another location off the patient when not in active use (i.e., when not needed within the next few moments).
- Place lasers in standby mode when not in active use.
- Do not place rubber catheter sleeves over electrosurgical electrodes.
